

Pipe pulling tools are designed to –

- Be used in sliplining operations where the pipe is pulled instead of pushed.
- Allow the pipe to be pulled by a cable and a winch.
- Minimize the chance of damage to the pipe, by spreading the force uniformly throughout the cross section of the new pipe.
- When and if it is necessary to assist the pulling winch with a push from an excavator bucket – the pull adapter will protect the end of the pipe.

These pullers are custom built and are available for round and non-round pipe profiles.
